UC1604

Single-Chip, Ultra-Low Power
65COM by 192SEG
Passive Matrix LCD Controller-Driver

INTRODUCTION

UC1604c is an advanced high-voltage mixed-signal CMOS IC, especially designed for the display needs of ultra-low power hand-held devices. 混合信号 超低功耗

This chip employs UltraChip's unique DCC (Direct Capacitor Coupling) driver architecture to achieve near crosstalk free images. 手持式设备 使用 电容耦合 架构

In addition to low power column and row drivers, the IC contains all necessary circuits for high-V LCD power supply, bias voltage generation, timing generation and graphics data memory. 图形数据记忆

Advanced circuit design techniques are employed to minimize external component counts and reduce connector size while achieving extremely low power consumption. 外元件 消耗 连接器的尺寸 成本

MAIN APPLICATIONS

- Cellular Phones, Smart Phones, PDA, and other battery operated palm top devices or portable Instruments 仪器

FEATURE HIGHLIGHTS

- Single chip controller-driver support 65x192 graphics STN LCD panels. 液晶显示屏幕 制图
- Support both row ordered and column ordered display buffer RAM access. 行阵列和列阵列 RAM缓存访问
- A software-readable ID pin to support configurable vender identification.
- Support both row-ordered and column-ordered display buffer RAM access.

- Support industry standard 8-bit parallel bus (8080 or 6800 mode), 4-wire and 3-wire serial buses (S8 and S9), and 2-wire I²C serial interface. 并行 I²C串行接口
- Ultra-low power consumption under all display patterns. 局部显示 在所模式
- Fully programmable Mux Rate, partial display, Bias Ratio and Frame Rate allow many flexible power management options. 偏离率 帖速度
- Software programmable frame rates at 76, 95, 132 and 168 Hz.
- Four software programmable temperature compensation coefficients.
- 7-x internal charge pump with on-chip pumping capacitor requires only 3 external capacitors to operate.
- On-chip Power-ON Reset makes RST pin optional.
- Very low pin count (10-pin) allows exceptional image quality in COG format on conventional ITO glass. 特别图像
- Flexible data addressing/mapping schemes to support wide ranges of software models and LCD layout placements.
- V_{DD} (digital) range (Typ.): 1.8V ~ 3.3V
V_{DD} (analog) range (Typ.): 2.7V ~ 3.3V
V_{LCD} range: 4.8V ~ 11.5V
- Available in gold bump dies
- COM/SEG bump information
Bump pitch: 27.6 μM
Bump gap: 12 μM
Bump surface: 2028 μM² (For UC1604cGAA)
1560 μM² (For UC1604cGBA)

ORDERING INFORMATION

Part Number	MTP	I ² C	Description
UC1604cGAA	Yes	Yes	Gold Bumped Die, Bump size 15.6uMx130uM
UC1604cGBA	Yes	Yes	Gold Bumped Die, Bump size 15.6uMx100uM, 15.6uMx115uM

General Notes**APPLICATION INFORMATION**

For improved readability, the specification contains many application data points. When application information is given, it is advisory and does not form part of the specification for the device. 说明书

USE OF I²C

The implementation of I²C is already included and tested in all silicon.

BARE DIE DISCLAIMER

All die are tested and are guaranteed to comply with all data sheet limits up to the point of wafer sawing. There is no post wafer saw/pack testing performed on individual die. Although the latest modern processes are utilized for wafer sawing and die pick-&-place into wafer pack carriers, UltraChip has no control of third party procedures in the handling, packing or assembly of the die. Accordingly, it is the responsibility of the customer to test and qualify their application in which the die is to be used. UltraChip assumes no liability for device functionality or performance of the die or systems after handling, packing or assembly of the die.

LIFE SUPPORT APPLICATIONS

These devices are not designed for use in life support appliances, or systems where malfunction of these products can reasonably be expected to result in personal injuries. Customer using or selling these products for use in such applications do so at their own risk.

CONTENT DISCLAIMER

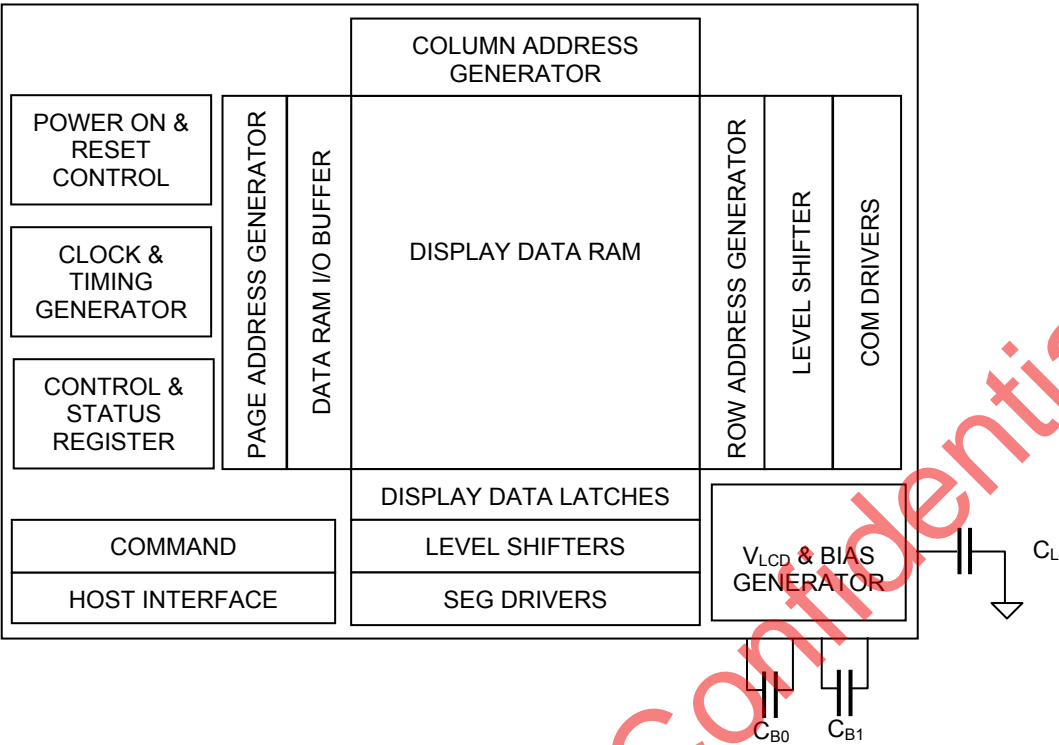

UltraChip believes the information contained in this document to be accurate and reliable. However, it is subject to change without notice. No responsibility is assumed by UltraChip for its use, nor for infringement of patents or other rights of third parties. No part of this publication may be reproduced, or transmitted in any form or by any means without the prior consent of UltraChip Inc. UltraChip's terms and conditions of sale apply at all times.

BLOCK DIAGRAM

PIN DESCRIPTION

Name	Type	Pins	Description																								
MAIN POWER SUPPLY																											
V _{DD} V _{DD2} V _{DD3}	PWR	5 7 5	V _{DD} supplies for Display Data RAM and digital logic, V _{DD2} supplies for V _{LCD} and V _D generator, V _{DD3} supplies for V _{BIAS} and other analog circuits. V _{DD2} /V _{DD3} should be connected to the same power source. But V _{DD} can be connected to a source voltage no higher than V _{DD2} /V _{DD3} . Please maintain the following relationship: $V_{DD} + 1.3V \geq V_{DD2/3} \geq V_{DD}$ ITO trace resistance needs to be minimized for V _{DD2} /V _{DD3} .																								
V _{SS} V _{SS2}	GND	6 6	Ground. Connect V _{SS} and V _{SS2} to the shared GND pin. In COG applications, minimize the ITO resistance for both V _{SS} and V _{SS2} .																								
LCD POWER SUPPLY & VOLTAGE CONTROL																											
V _{B1+} V _{B1-} V _{B0+} V _{B0-}	PWR	4 4 4 4	LCD Bias Voltages. These are the voltage sources to provide SEG driving currents. These voltages are generated internally. Connect capacitors of C _{BX} value between V _{BX+} and V _{BX-} . See the "LCD Voltage Setting" section for more details. In COG application, the resistance of these ITO traces directly affects the SEG driving strength of the resulting LCD module. Minimize these trace resistance is critical in achieving high quality image.																								
V _{LCDIN} V _{LCDOUT}	PWR	4 4	Main LCD Power Supply. When internal V _{LCD} is used, connect these pins together. When external V _{LCD} source is used, connect external V _{LCD} source to V _{LCDIN} pins and leave V _{LCDOUT} open. Capacitor C _L should be connected between V _{LCD} and V _{SS} . In COG applications, keep the ITO trace resistance around 70 Ω.																								
<ul style="list-style-type: none"> Recommended capacitor values: C_B: 2.2μF/5V or 300x(LCD load capacitance), whichever is higher. C_L: 330nF/25V is appropriate for most applications. 																											
HOST INTERFACE																											
BM0 BM1	I	1 1	<p>Bus mode: The interface bus mode is determined by BM[1:0] and D[7] by the following relationship:</p> <table border="1"> <thead> <tr> <th>BM[1:0]</th><th>D[7]</th><th>Mode</th><th>Remark</th></tr> </thead> <tbody> <tr> <td>11</td><td>Data</td><td>6800/8-bit</td><td></td></tr> <tr> <td>10</td><td>Data</td><td>8080/8-bit</td><td></td></tr> <tr> <td>00</td><td>--</td><td>4-wire SPI w/ 8-bit token</td><td>(S8: conventional)</td></tr> <tr> <td>01</td><td>0</td><td>3-wire SPI w/ 9-bit token</td><td>(S9: conventional)</td></tr> <tr> <td>01</td><td>1</td><td>2-wire serial (I²C)</td><td></td></tr> </tbody> </table>	BM[1:0]	D[7]	Mode	Remark	11	Data	6800/8-bit		10	Data	8080/8-bit		00	--	4-wire SPI w/ 8-bit token	(S8: conventional)	01	0	3-wire SPI w/ 9-bit token	(S9: conventional)	01	1	2-wire serial (I ² C)	
BM[1:0]	D[7]	Mode	Remark																								
11	Data	6800/8-bit																									
10	Data	8080/8-bit																									
00	--	4-wire SPI w/ 8-bit token	(S8: conventional)																								
01	0	3-wire SPI w/ 9-bit token	(S9: conventional)																								
01	1	2-wire serial (I ² C)																									
CS1/A3 CS0/A2	I	1 1	Chip Select. Chip is selected when CS1="H" and CS0 = "L". When the chip is not selected, D[7:0] will be of high impedance. In I ² C mode, these two pins specifies bits 3~2 of UC1604c' device address (A[3:2]).																								
RST	I	1	When RST="L", all control registers are re-initialized by their default states. Since UC1604c has built-in Power-On Reset, the RST pin is not required for proper chip operation. An RC Filter has been included on-chip. There is no need for external RC noise filter. When RST is not used, connect the pin to V _{DD} .																								
CD	I	1	Select Control data or Display data for read/write operation. In S9, CD pin is not used. Connect CD to V _{SS} when not used. "L": Control data "H": Display data																								
ID	I	1	ID may be used for production identification. Connect ID to V _{DD} for "H" or V _{SS} for "L".																								

Name	Type	Pins	Description																																													
WR0 WR1	I	1 1	WR [1:0] controls the read/write operation of the host interface. See Host Interface section for details. In parallel mode, the meaning of WR[1:0] depends on which interface it is in, 6800 or 8080 mode. In serial interface modes, these two pins are not used, Connect them to V _{SS} .																																													
D7~D0	I/O	8	Bi-directional bus for both serial and parallel host interfaces. In serial modes, connect D[0] to SCK, D[5:3] to SDA. <table><tr><td></td><td>D7</td><td>D6</td><td>D5</td><td>D4</td><td>D3</td><td>D2</td><td>D1</td><td>D0</td></tr><tr><td>8-bit (BM=1x)</td><td>D7</td><td>D6</td><td>D5</td><td>D4</td><td>D3</td><td>D2</td><td>D1</td><td>D0</td></tr><tr><td>s8 (BM=00)</td><td>--</td><td>--</td><td>SDA</td><td>SDA</td><td>SDA</td><td>--</td><td>--</td><td>SCK</td></tr><tr><td>S9 (BM=01)</td><td>0</td><td>--</td><td>SDA</td><td>SDA</td><td>SDA</td><td>--</td><td>--</td><td>SCK</td></tr><tr><td>I²C (BM=01)</td><td>1</td><td>--</td><td>SDA</td><td>SDA</td><td>SDA</td><td>--</td><td>--</td><td>SCK</td></tr></table> For better drive ability, connect D[5:3] together. Always connect unused pins to either V _{SS} or V _{DD} .		D7	D6	D5	D4	D3	D2	D1	D0	8-bit (BM=1x)	D7	D6	D5	D4	D3	D2	D1	D0	s8 (BM=00)	--	--	SDA	SDA	SDA	--	--	SCK	S9 (BM=01)	0	--	SDA	SDA	SDA	--	--	SCK	I ² C (BM=01)	1	--	SDA	SDA	SDA	--	--	SCK
	D7	D6	D5	D4	D3	D2	D1	D0																																								
8-bit (BM=1x)	D7	D6	D5	D4	D3	D2	D1	D0																																								
s8 (BM=00)	--	--	SDA	SDA	SDA	--	--	SCK																																								
S9 (BM=01)	0	--	SDA	SDA	SDA	--	--	SCK																																								
I ² C (BM=01)	1	--	SDA	SDA	SDA	--	--	SCK																																								
HIGH VOLTAGE LCD DRIVER OUTPUT																																																
SEG1 ~ SEG192	HV	192	SEG (column) driver outputs. Support up to 192 pixels. Leave unused SEG drivers open-circuit.																																													
COM1 ~ COM64	HV	64	COM (row) driver outputs. Support up to 64 rows. When designing LCM, always start from COM1. If the LCM has <i>N</i> pixel rows and <i>N</i> is less than 64, set CEN to be <i>N</i> -1, and leave COM drivers [<i>N</i> +1 ~ 64] open-circuit.																																													
CIC	HV	2	Icon driver outputs. Leave it open if not used.																																													
MISC. PINS																																																
V _{DDX}		5	Auxiliary V _{DD} . This pin is connected to the main V _{DD} bus within the IC. It's provided to facilitate chip configurations in COG application. There's no need to connect V _{DDX} to main V _{DD} externally and it should <u>NOT</u> be used to provide V _{DD} power to the chip.																																													
TST4	I	4	TST4 is used as one of the high voltage power supply for MTP programming operation. For COG designs, please wire out TST4 with trace resistance between 30~50 Ω.																																													
TST2	I/O	2	Test I/O pins. Leave these pins open during normal use.																																													
POR		1	Power-ON Reset control. Connect the POR pin to V _{DD} for "H"; to V _{SS} for "L" to control the POR register. "L": Power-ON Reset Enable. "H": Power-ON Reset Disabled.																																													
Dummy		25	Dummy pins are NOT connected inside the IC.																																													
Note: Several control registers will specify "0 based index" for COM and SEG electrodes. In those situations, COM _{<i>X</i>} or SEG _{<i>X</i>} will correspond to index <i>X</i> -1, and the value range for those index register will be 0~63 for COM and 0~191 for SEG.																																																

RECOMMENDED COG LAYOUT

NOTES FOR V_{DD} WITH COG:

The operation condition, $V_{DD}=1.8V$ (typical), should be satisfied under all operating conditions. UC1604c' peak current (I_{DD}) can be up to ~15mA during high speed data-write to UC1604c' on-chip SRAM. Such high pulsing current mandates very careful design of V_{DD} and V_{SS} ITO trances in COG modules. When V_{DD} and V_{SS} trace resistance is not low enough, the pulsing I_{DD} current can cause the actual on-chip V_{DD} to drop to below 1.7V and cause the IC to malfunction.

CONTROL REGISTERS

UC1604c contains registers, which control the chip operation. The following table is a summary of these control registers, a brief description and the default values. These registers can be modified by commands, which will be described in the next two sections, Command Table and Command Description.

Name: The Symbolic reference of the register. Note that, some symbol name refers to bits (flags) within another register.

Default: Numbers shown in **Bold** font are default values after Power-Up-Reset and System-Reset.

Name	Bits	Default	Description
SL	6	00H	Scroll Line. Scroll the displayed image up by SL rows. The valid SL value is between 0 (for no scrolling) and (64). Setting SL outside of this range causes undefined effect on the displayed image.
CA	8	00H	Display Data RAM Column Address. Value range is 0 ~ 191 . (Used in Host to Display Data RAM access)
PA	4	0H	Display Data Page Row Address. Value range is 0 ~ 8 . (Used in Host to Display Data RAM access)
BR	2	3H	Bias Ratio. The ratio between V_{LCD} and V_D . 00b: 6 01b: 7 10b: 8 11b: 9
TC	2	0H	Temperature Compensation (per °C) 00b: -0.00% 01b: -0.05% 10b: -0.10% 11b: -0.15%
PM	8	49H	Electronic Potentiometer to fine tune V_D and V_{LCD}
PMO	6	00H	PM offset.
PC	3	6H	Power Control. PC[1:0]: low pump charge current select 00b: 0.6mA 01b: 1.0mA 10b: 1.4mA 11b: 2.3mA PC[2]: to program the build-in charge pump stages 0b: External V_{LCD} 1b: Internal V_{LCD} (7x charge pump)
AC	3	1H	Address Control: AC[0]: WA: Automatic column/row Wrap Around (Default 1: ON) AC[1]: Auto-Increment order 0: Column (CA) first 1: Page (PA) first AC[2]: RID: RA (row address) auto increment direction (L:+1 H:-1)
DC	3	0H	Display Control: DC[0]: PXV: Pixels Inverse. Bit-wise data inversion. (Default 0: OFF) DC[1]: APO: All Pixels ON (Default 0: OFF) DC[2]: Display ON/OFF (Default 0: OFF)
LC	6	08H	LCD Control: LC[0]: Reserved (always set to 0) LC[1]: MX, Mirror X. SEG/Column sequence inversion (Default: 0:OFF) LC[2]: MY, Mirror Y. COM/Row sequence inversion (Default: 0:OFF) LC[4:3]: Line Rate (Klps: Kilo-Line-per-second) 00b: 76 fps 01b: 95 fps 10b: 132 fps 11b: 168 fps LC[5]: Partial Display. 0b: Disabled. Mux-Rate = CEN+1 (DST, DEN not used) 1b: Enabled. Mux-Rate = DEN-DST+1

Name	Bits	Default	Description
CEN	6	3FH	COM scanning end (last COM with full line cycle, 0-based index)
DST	6	00H	Display start (first COM with active scan pulse, 0-based index)
DEN	6	3FH	Display end (last COM with active scan pulse, 0-based index)
			Please maintain the following relationship: CEN = "the actual number of pixel rows on the LCD" – 1 CEN ≥ DEN ≥ DST+ 9
MTPC	5	00H	MTP Programming Control: MTPC[2:0] : MTP command <div> <div>000 : Idle</div> <div>001 : Read</div> <div>010 : Erase</div> <div>011 : Program</div> <div>1XX : For UltraChip debug use only</div> </div> MTPC[3] : MTP Enable (automatically cleared after each MTP command) MTPC[4] : Ignore/Use MTP. <div> <div>0: Ignore</div> <div>1: Use</div> </div>
MTPM	6	00H	MTP Write Mask. For each bit, Bit =1: program, Bit=0: no action.
APC		N/A	Advanced Program Control. For UltraChip only. Please do not use.
Status Registers			
OM	2	–	Operating Modes (Read only) <div> <div>00b: Reset</div> <div>01b: (Not used)</div> <div>10b: Sleep</div> <div>11b: Normal</div> </div>
ID	1	PIN	Access the connected status of ID pins.
POR	1	PIN	Power-ON Reset control. Controlled by the POR pin. "L": Power-ON Reset Enable. "H": Power-ON Reset Disabled.

COMMAND TABLE

The following is a list of host commands supported by UC1604c

C/D: 0: Control, 1: Data **W/R**: 0: Write Cycle, 1: Read Cycle **D7~D0**: #: Useful Data bits -: Don't Care

No	Command	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Action	Default

Any bit pattern other than those listed above may result in NOP (No Operation).

COMMAND DESCRIPTION

1. Write Data Byte to Memory

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Write data	1	0	8-bit data write to SRAM							

2. Read Data Byte from Memory

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Read data	1	1	8-bit data read from SRAM							

Write/Read Data Byte (Command 1,2) access Display Data RAM based on Page Address (PA) register and Column Address (CA) register. To minimize bus interface cycles, PA and CA will increase or decrease automatically after each bus cycle, depending on the setting of Access Control (AC) registers. PA and CA can also be programmed directly by issuing *Set Page Address* and *Set Column Address* commands.

If Wrap-Around (WA) is OFF (AC[0] = 0), CA will stop increasing after reaching the end of the page, and system programmers need to set the values of PA and CA explicitly. If WA is ON (AC[0]=1), when CA reaches the end of the page, CA will be reset to 0 and PA will increase or decrease by 1, depending on the setting of Page Increment Direction (PID, AC[2]). When PA reaches the boundary of RAM, PA will be wrapped around to the other end of RAM and continue.

3. Get Status

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Get Status	0	1	ID	MX	MY	WA	DE	WS	MD	MS
	0	1	VER	POR	PMO5	PMO4	PMO3	PMO2	PMO1	PMO0

Status1 definitions:

ID: Provide access to ID pins connection status.

MX: Status of register LC[1], mirror X.

MY: Status of register LC[2], mirror Y.

WA: Status of register AC[0]. Automatic column/row wrap around.

DE: Display Enable flag. DE=1 when display is enabled.

WS: MTP Operation succeeded

MD: MTP Option (1 for MTP version, 0 for non-MTP version)

MS: MTP action status

Status2 definitions:

Ver: IC Version, 0~1.

POR: *Power-ON Reset control*.

PMO[5:0]: PM offset value. Default: 00H

4. Set Column Address

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Column Address LSB CA[3:0]	0	0	0	0	0	0	CA3	CA2	CA1	CA0
Set Column Address MSB CA[7:4]	0	0	0	0	0	1	CA7	CA6	CA5	CA4

Set the SRAM column address before Write/Read memory from host interface.

CA value range: 0~191

5. Set Temperature Compensation

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Temperature Comp. TC[1:0]	0	0	0	0	1	0	0	1	TC1	TC0

Set V_{BIAS} temperature compensation coefficient (%-per-degree-C)

Temperature compensation curve definition:

00b= -0.00%/°C

01b= -0.05%/°C

10b= -0.10%/°C

11b= -0.15%/°C

6. Set Power Control

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Power Control PC[2:0]	0	0	0	0	1	0	1	PC2	PC1	PC0

PC[1:0] : to select low-pump charge current

00b: 0.6mA

01b: 1.0mA

10b: 1.4mA

11b: 2.3mA

Set PC[2] : to program the build-in charge pump stages.

0b: External V_{LCD}

1b: Internal V_{LCD} (7x charge pump)

7. Set Advanced Program Control

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Adv. Program Control APC[R][7:0] (Double-byte command)	0	0	0	0	1	1	0	0	R	R
	0	0	APC7	APC6	APC5	APC4	APC3	APC2	APC1	APC0

For UltraChip only. Please Do NOT use.

8. Set Scroll Line

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Scroll Line SL[5:0]	0	0	0	1	SL5	SL4	SL3	SL2	SL1	SL0

Set the scroll line number.

Scroll line setting will scroll the displayed image up by SL rows. Icon output CIC will not be affected by Set Scroll Line command.

9. Set Page Address

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Page Address PA[3:0]	0	0	1	0	1	1	PA3	PA2	PA1	PA0

Set the SRAM page address before write/read memory from host interface. Each page of SRAM corresponds to 8 COM lines on LCD panel, except for the last page. The last page corresponds to the icon output CIC.

Possible value = 0~8.

10. Set V_{BIAS} Potentiometer

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set V _{BIAS} Potentiometer PM [7:0] (Double-byte command)	0	0	1	0	0	0	0	0	0	1
	0	0	PM7	PM6	PM5	PM4	PM3	PM2	PM1	PM0

Program V_{BIAS} Potentiometer (PM[7:0]). See section LCD Voltage Setting for more detail.

Effective range: 0 ~ 255 (Default: **49H**)

11. Set Partial Display Control

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Partial Display Enable LC [5]	0	0	1	0	0	0	0	1	0	LC5

This command is used to enable partial display function.

LC[5] : **0b: Disable Partial Display**, Mux-Rate = CEN+1 (DST, DEN not used.)

1b: Enable Partial Display, Mux-Rate = DEN-DST+1

12. Set RAM Address Control

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set AC [2:0]	0	0	1	0	0	0	1	AC2	AC1	AC0

Program registers AC[2:0] for RAM address control. It controls the auto-increment behavior of CA and PA.

AC[0] – WA, Automatic column/page wrap around.

0: CA or PA (depends on AC[1]= 0 or 1) will stop increasing after reaching boundary

1: CA or PA (depends on AC[1]= 0 or 1) will restart, and CA or PA will increase by one.

AC[1] – Auto-Increment order

0 : column (CA) increasing (+1) first until CA reach CA boundary, then PA will increase by (+/-1).

1 : page (PA) increasing (+/-1) first until PA reach PA boundary, then CA will increase by (+1).

AC[2] – PID, page address (PA) auto increment direction (0/1 = +/- 1)

When WA=1 and CA reaches CA boundary, PID controls whether page address will be adjusted by +1 or -1.

13. Set Frame Rate

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Frame Rate LC [4:3]	0	0	1	0	1	0	0	0	LC4	LC3

Program LC [3] for frame rate setting

00b: 76 fps

01b: 95 fps

10b: 132 fps

11b: 168 fps

(fps: frame-per-second)

14. Set All Pixel ON

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set All Pixel ON DC [1]	0	0	1	0	1	0	0	1	0	DC1

Set DC[1] to force all SEG drivers to output ON signals. This function has no effect on the existing data stored in display RAM.
(Default: 0)

15. Set Inverse Display

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Inverse Display DC [0]	0	0	1	0	1	0	0	1	1	DC0

Set DC[0] to force all SEG drivers to output the inverse of the data (bit-wise) stored in display RAM. This function has no effect on the existing data stored in display RAM. (Default: 0)

16. Set Display Enable

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Display Enable DC[2]	0	0	1	0	1	0	1	1	1	DC2

This command is for programming register DC[2]. When DC[2] is set to 1, UC1604c will first exit from sleep mode, restore the power and then turn on COM drivers and SEG drivers. (Default: 0)

17. Set LCD Mapping Control

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set LCD Control LC[2:1]	0	0	1	1	0	0	0	MY	MX	0

Set LC[2:1] for COM (row) mirror (MY), SEG (column) mirror (MX). (Default: 00b)

MY is implemented by reversing the mapping order between RAM and COM (row) electrodes. The data stored in RAM is not affected by MY command. MY will have immediate effect on the display image.

MX is implemented by selecting the CA or 63-CA as write/read (from host interface) display RAM column address so this function will only take effect after rewriting the RAM data.

18. System Reset

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
System Reset	0	0	1	1	1	0	0	0	1	0

This command will activate the system reset.

Control register values will be reset to their default values. Data store in RAM will not be affected.

19. NOP

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
No Operation	0	0	1	1	1	0	0	0	1	1

This command is used for "no operation".

20. Set Test Control

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set TT (Double byte command)	0	0	1	1	1	0	0	1	TT	
	0	0	For test only							

This command is used for UltraChip production testing. Please do NOT use.

21. Set LCD Bias Ratio

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set Bias Ratio BR [1:0]	0	0	1	1	1	0	1	0	BR1	BR0

Bias ratio definition:

00b= 6

01b= 7

10b= 8

11b= 9

22. Set COM End

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set CEN [5:0]	0	0	1	1	1	1	0	0	0	1
(Double-byte command)	0	0	-	-	CEN register parameter					

This command programs the ending COM electrode. CEN defines the number of used COM electrodes, and it should correspond to the number of pixel-rows in the LCD. When the LCD has less than 64 pixel rows, the LCM designer should set CEN to $N-1$ (where N is the number of pixel rows) and use COM1 through COM- N as COM driver electrodes. (Default: **63**)

23. Set Partial Display Start

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set DST [5:0]	0	0	1	1	1	1	0	0	1	0
(Double-byte command)	0	0	-	-	DST register parameter					

This command programs the starting COM electrode, which has been assigned a full scanning period and will output an active COM scanning pulse.

24. Set Partial Display End

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set DEN [5:0]	0	0	1	1	1	1	0	0	1	1
(Double-byte command)	0	0	-	-	DEN register parameter					

This command programs the ending COM electrode, which has been assigned a full scanning period and will output an active COM scanning pulse.

CEN, DST, and DEN are 0-based index of COM electrodes. They control only the COM electrode activity, and do not affect the mapping of display RAM to each COM electrodes. The image displayed by each pixel row is therefore not affected by the setting of these three registers.

When LC[5]=1b, the Mux-Rate is narrowed down to $DEN - DST + 1$. When MUX rate is reduced, reduce the frame rate accordingly to reduce power. Changing MUX rate also require BR and V_{LCD} to be reduced.

For minimum power consumption, set LC[5]=1b, set (DST, DEN, CEN) to minimize Mux rate, use slowest frame rate which satisfies the flicker requirement, set PC[0]=0b, and use lowest BR, lowest V_{LCD} which satisfies the contrast requirement. When Mux-Rate is under 16, it is recommended to set BR=6 for optimum power saving.

In either case, DST/DEN defines a small subsection of the display which will remain active while shutting down all the rest of the display to conserve energy.

Keep $CEN \geq DEN \geq DST + 9$

Display Data Direction	Function Setting			Image in DDRAM (Physical origin: upper left corner)	Display Data Direction	Function Setting			Image in DDRAM (Physical origin: upper left corner)
	AIO AC[1]	MX LC[1]	RID AC[2]			AIO AC[1]	MX LC[1]	RID AC[2]	
Normal	0	0	0		X-Y Exchange	1	0	0	
Y-mirror	0	0	1		X-Y Exchange Y-mirror	1	0	1	
X-mirror	0	1	0		X-Y Exchange X-mirror	1	1	0	
X-mirror Y-mirror	0	1	1		X-Y Exchange X-mirror Y-mirror	1	1	1	

25. Set MTP Operation Control

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set MTPC [4:0] (Double-byte command)	0	0	1	1	1	1	1	0	0	0
	0	0	-	-	-	MTPC4	MTPC3	MTPC2	MTPC1	MTPC0

This command is for MTP operation control: (MTPC[4:0] : default: **D0H**)

MTPC[2:0] : MTP command

000 : Sleep 001 : MTP Read 010 : MTP Erase 011 : MTP Program
1xx : For UltraChip use only.

MTPC[3] : MTP Enable (automatically cleared each time after MTP command is done)

MTPC[4] : MTP value valid (set H to active MTP value)

DC[2] and MTPC[3] are mutually exclusive. Only one of these two control flags can be set to ON at any time. In other words, when DC[2] is ON, all MTP operations will be blocked, and, when MTP operation is active, set DC[2] to 1 will be blocked.

26. Set MTP Write Mask

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set MTPM [5:0] (Double-byte command)	0	0	1	1	1	1	1	0	0	1
	0	0	-	-	MTPM[5:0]					

This command enables Write to each of the individual MTP bits. When MTPM[x]=1, the x-th bit of the MTP memory will be programmed to "1". MTPM[x]=0 means no Write action for x-th bit. And the content of this bit will not change.

The amount of "programming current" increases with the number of 1's in MTPM. If the "programming current" appears to be too high for the LCM design (e.g. TST4 ITO trace is not wide enough to supply the current), use multiple write cycles and distribute the 1's evenly into these cycles.

MTPM[5:0] : Set PMO value (Default: 00H)

27. Set V_{MTP1} Potentiometer

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set VMTP1 [7:0] (Double-byte command)	0	0	1	1	1	1	0	1	0	0
	0	0	VMTP1[7:0]							

This command is for fine tuning V_{OPT1} setting (with BR=00).

28. Set V_{MTP2} Potentiometer

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set VMTP2 [7:0] (Double-byte command)	0	0	1	1	1	1	0	1	0	1
	0	0	VMTP2[7:0]							

This command is for fine tuning V_{MTP2} setting (with BR=11).

29. Set MTP Write Timer

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set MTPWT [7:0] (Double-byte command)	0	0	1	1	1	1	0	1	1	0
	0	0	MTPWT[7:0]							

This command is only valid when MTPC[3]=1.

30. Set MTP Read Timer

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Set MTPRT [7:0] (Double-byte command)	0	0	1	1	1	1	0	1	1	1
	0	0	MTPRT[7:0]							

This command is only valid when MTPC[3]=1.

Serial Read Command (Enable only in S8/S9 mode):

31. Get Status

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Get Status	0	0	1	1	1	1	1	1	1	0
	0	1	ID	MX	MY	WA	DE	WS	MD	MS
	0	1	VER	POR	PMO5	PMO4	PMO3	PMO2	PMO1	PMO0

See command 3.

32. Read Data Byte from Memory

Action	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0
Read data (double-byte command)	0	0	1	1	1	1	1	1	1	1
	1	1	#	#	#	#	#	#	#	#

See command 2 for more information.

Ultrachip Confidential

LCD VOLTAGE SETTING

MULTIPLEX RATES

Multiplex Rate is completely software programmable in UC1604c via registers CEN, DST, DEN, and partial display control flags LC[5].

Combined with low power partial display mode and a low bias ratio of 6, UC1604c can support wide variety of display control options. For example, when a system goes into stand-by mode, a large portion of LCD screen can be turned off to conserve power.

BIAS RATIO SELECTION

Bias Ratio (*BR*) is defined as the ratio between V_{LCD} and V_D , i.e.

$$BR = V_{LCD}/V_D,$$

where $V_D = V_{B1+} - V_{B1-} = V_{B0+} - V_{B0-}$.

The theoretical optimum *Bias Ratio* can be estimated by $\sqrt{Mux} + 1$. *BR* of value 15~20% lower/higher than the optimum value calculated above will not cause significant visible change in image quality.

UC1604c supports four *BR* as listed below. *BR* can be selected by software program.

BR	0	1	2	3
Bias Ratio	6	7	8	9

Table 1: Bias Ratios

TEMPERATURE COMPENSATION

Four different temperature compensation coefficients can be selected via software. The four coefficients are given below:

TC	0	1	2	3
% per °C	-0.00	-0.05	-0.10	-0.15

Table 2: Temperature Compensation

V_{LCD} GENERATION

V_{LCD} may be supplied either by internal charge pump or by external power supply. The source of V_{LCD} is controlled by PC[2].

When V_{LCD} is generated internally, the voltage level of V_{LCD} is determined by three control registers: *BR* (Bias Ratio), *PM* (Potentiometer), and *TC* (Temperature Compensation), with the following relationship:

$$V_{LCD} = (C_{V0} + C_{PM} \times PM) \times (1 + (T - 25) \times C_T \%)$$

where

C_{V0} and C_{PM} are two constants, whose value depends on the setting of *BR* register, as illustrated in the table on the next page,

PM is the numerical value of *PM* register,

T is the ambient temperature in °C, and

C_T is the temperature compensation coefficient as selected by *TC* register.

V_{LCD} FINE TUNING

Black-and-white STN LCD is sensitive to even a 1% mismatch between IC driving voltage and the V_{OP} of LCD. However, it is difficult for LCD makers to guarantee such high precision matching of parts from different vendors. It is therefore necessary to adjust V_{LCD} to match the actual V_{OP} of the LCD.

For the best result, software based approach for V_{LCD} adjustment or MTP is the recommended method for V_{LCD} fine-tuning. System designers should always consider the contrast fine tuning requirement before finalizing on the LCM design.

LOAD DRIVING STRENGTH

The power supply circuit of UC1604c is designed to handle LCD panels with loading up to ~24nF using 20-Ω/Sq ITO glass with $V_{DD2/3} \geq 2.6V$. For larger LCD panels, use lower resistance ITO glass packaging.

V_{LCD} QUICK REFERENCEV_{LCD} Programming Curve.

BR	C _{V0} (V)	C _{PM} (mV)	PM	V _{LCD} Range (V)
6	4.782	12.151	0	4.78
			255	7.88
7	5.570	14.141	0	5.57
			255	9.18
8	6.360	16.149	0	6.36
			255	10.48
9	7.143	18.142	0	7.14
			240	11.50

Note:

1. For good product reliability, keep V_{LCD} under **11.5V** over all temperature.
2. The integer values of BR above are for reference only and may have slight shift.

HI-V GENERATOR AND BIAS REFERENCE CIRCUIT

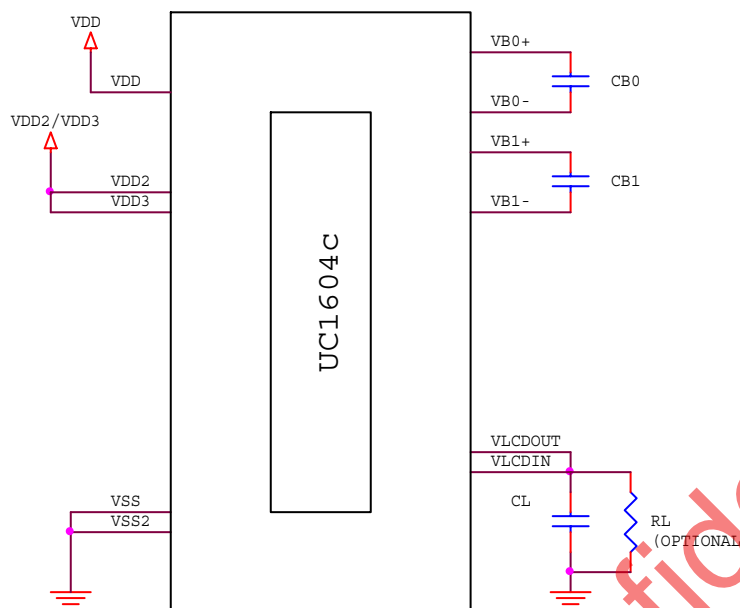

FIGURE 1: Reference circuit using internal Hi-V generator circuit

Note

Sample component values: (The illustrated circuit and component values are for reference only. Please optimize for specific requirements of each application.)

C_{Bx} : 2.2 $\mu\text{F}/5\text{V}$ or 300x LCD load capacitance, whichever is higher.

C_L : 330nF(25V) is appropriate for most applications.

R_L : 3.3M~10M Ω to act as a draining circuit when V_{DD} is shut down abruptly.

LCD DISPLAY CONTROLS

CLOCK & TIMING GENERATOR

UC1604c contains a built-in system clock. All required components for the clock oscillator are built-in. No external parts are required.

4 different frame rates are provided for system design flexibility. The frame rate is controlled by register LC[4:3]. When Mux-Rate is above 45, Frame rate: 76fps, 95fps, 132fps, and 168 fps.

When Mux-Rate is lowered to 44, 33, 22, and 17, frame rate will be scaled down automatically by 1.5, 2, 3, and 4 times to reduce power consumption.

Choose lower frame rate for lower power, and choose higher frame rate to improve LCD contrast and minimize flicker.

DRIVER MODES

COM and SEG drivers can be in either Idle mode or Active mode, controlled by Display Enable flag (DC[2]). When SEG and COM drivers are in idle mode, they will be connected together to ensure zero DC condition on the LCD.

DRIVER ARRANGEMENTS

The naming conventions are: COMx, where x = 1~64, refers to the row driver for the x-th row of pixels on the LCD panel.

The mapping of COM(x) to LCD pixel rows is fixed and it is not affected by SL, CEN, DST, DEN, MX or MY settings.

DISPLAY CONTROLS

There are three groups of display control flags in the control register DC: Driver Enable (DE), All-Pixel-ON (APO) and Inverse (PXV). DE has the overriding effect over PXV and APO.

DRIVER ENABLE (DE)

Driver Enable is controlled by the value of DC[2] via *Set Display Enable* command. When DC[2] is set to OFF (logic "0"), both COM and SEG drivers will become idle and UC1604c will put itself into Sleep Mode to conserve power.

When DC[2] is set to ON, the DE flag will become "1", and UC1604c will first exit from Sleep Mode, restore the power (V_{LCD} , V_D etc.) and then turn on COM and SEG drivers.

ALL PIXELS ON (APO)

When set, this flag will force all SEG drivers to output ON signals, disregarding the data stored in the display buffer.

This flag has no effect when Display Enable is OFF and it has no effect on data stored in RAM.

INVERSE (PXV)

When this flag set to ON, SEG drivers will output the inverse of the value it received from the display buffer RAM (bit-wise inversion). This flag has no impact on data stored in RAM.

PARTIAL DISPLAY

UC1604c provides flexible control of Mux Rate and active display area. Please refer to commands *Set COM End*, *Set Partial Display Start*, and *Set Partial Display End* for more detail.

ITO LAYOUT AND LC SELECTION

Since COM scanning pulses of UC1604c can be as short as 91μS, it is critical to control the RC delay of COM and SEG signal to minimize crosstalk and maintain good mass production consistency.

COM TRACES

Excessive COM scanning pulse RC decay can cause fluctuation of contrast and increase COM direction crosstalk.

Please limit the worst case of COM signals RC delay (RC_{MAX}) as calculated below

$$(R_{ROW} / 2.7 + R_{COM}) \times C_{ROW} < 9.23\mu S$$

where

C_{ROW} : LCD loading capacitance of one row of pixels. It can be calculated by $C_{LCD}/\text{Mux-Rate}$, where C_{LCD} is the LCD panel capacitance.

R_{ROW} : ITO resistance over one row of pixels within the active area

R_{COM} : COM routing resistance from IC to the active area + COM driver output impedance.

In addition, please limit the min-max spread of RC decay to be:

$$|RC_{MAX} - RC_{MIN}| < 2.76\mu S$$

so that the COM distortions on the top of the screen to the bottom of the screen are uniform.

(Use worst case values for all calculations)

SEG TRACES

Excessive SEG signal RC decay can cause image dependent changes of medium gray shades and sharply increase the crosstalk of SEG direction.

For good image quality, please minimize SEG ITO trace resistance and limit the worst case of SEG signal RC delay as calculated below.

$$(R_{COL} / 2.7 + R_{SEG}) \times C_{COL} < 6.30\mu S$$

where

C_{COL} : LCD loading capacitance of one pixel column. It can be calculated by $C_{LCD} / (\# \text{ of column})$, where C_{LCD} is the LCD panel capacitance.

R_{COL} : ITO resistance over one column of pixels within the active area

R_{SEG} : SEG routing resistance from IC to the active area + SEG driver output impedance.

(Use worst case values for all calculations)

SELECTING LIQUID CRYSTAL

The selection of LC material is crucial to achieve the optimum image quality of finished LCM.

When $(V_{90}-V_{10})/V_{10}$ is too large, image contrast will deteriorate, and images will look murky and dull.

When $(V_{90}-V_{10})/V_{10}$ is too small, image contrast will become too strong, and crosstalk will increase.

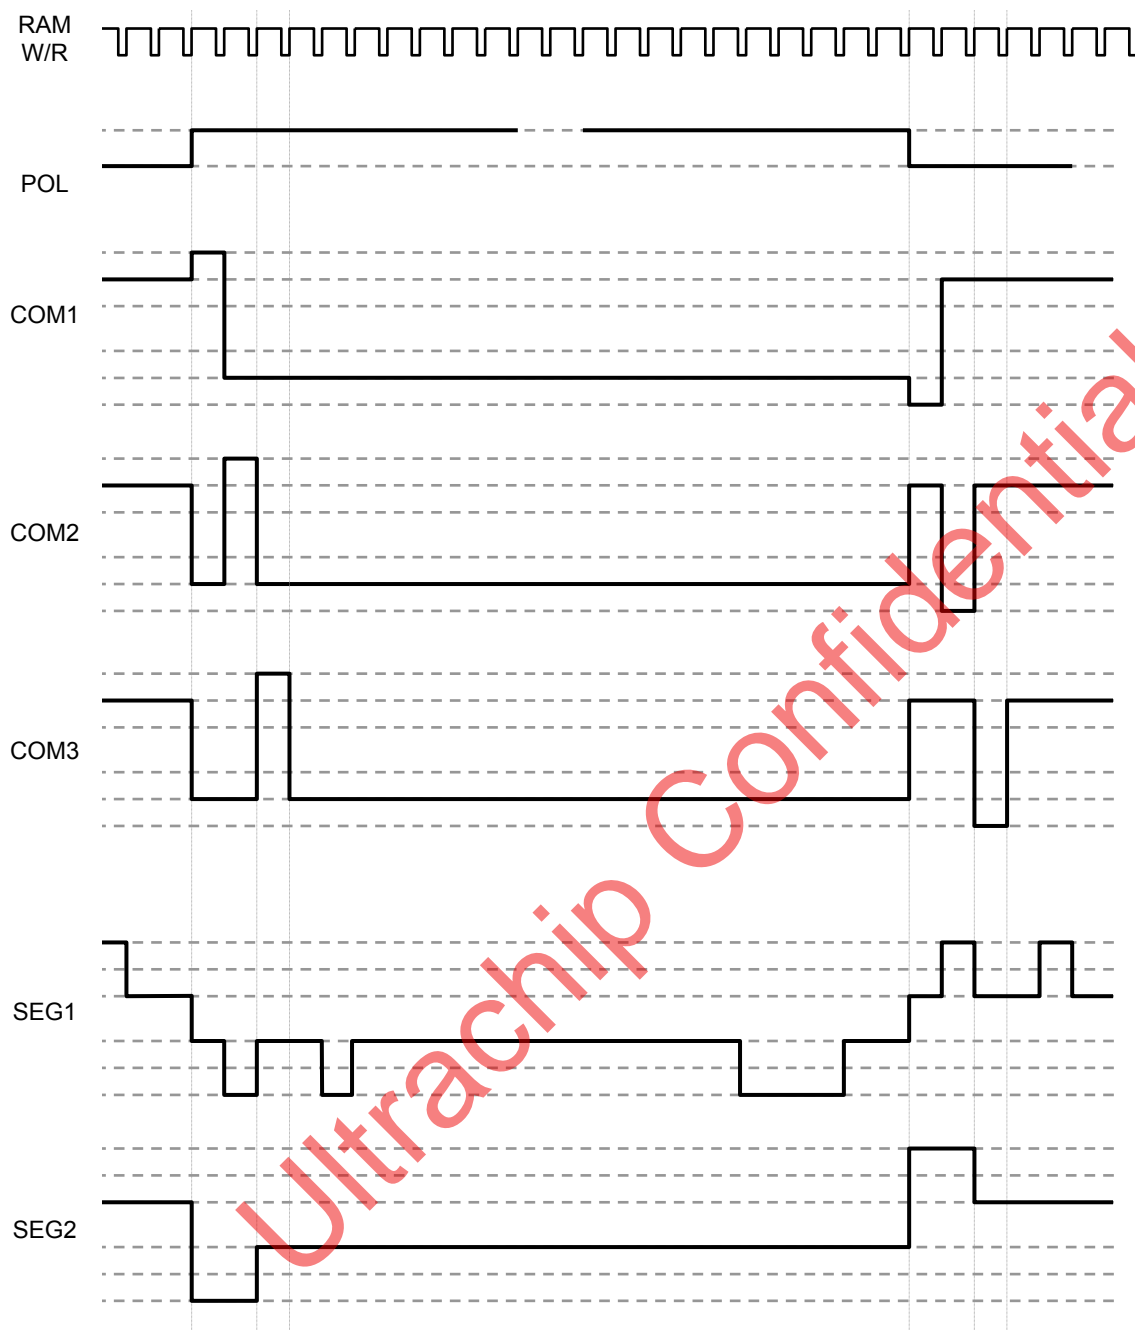

For the best result, it is recommended the LC material has the following characteristics:

$$(V_{90}-V_{10})/V_{10} = (V_{ON}-V_{OFF})/V_{OFF} \times 0.72 \sim 0.80$$

where V_{90} and V_{10} are the LC characteristics, and V_{ON} and V_{OFF} are the ON and OFF V_{RMS} voltage produced by LCD driver IC at the specific Mux-rate.

Two examples are provided below:

Duty	Bias	$V_{ON}/V_{OFF} - 1$	x0.80	x0.72
1/65	1/9	13.3%	10.6%	9.6%
1/65	1/8	13.1%	10.5%	9.5%

**FIGURE 2:** COM and SEG Electrode Driving Waveform

HOST INTERFACE

As summarized in the table below, UC1604c supports 2 8-bit parallel bus protocols and 3 serial bus protocols. Designers can choose either the 8-bit parallel bus to achieve high data transfer rate, or use serial bus to create compact LCD modules and minimize connector pins.

		Bus Type					
		8080	6800	S8(4-wire)	S9(3-wire)	I ² C(2-wire)	
Width		8-bit	8-bit	Serial			
Access		Read / Write		Read (status) / Write		R / W	
Control & Data Pins	BM[1:0]	10	11	00	01	01	
	D[7]	Data	Data	--	0	1	
	CS[1:0]	Chip Select					A[3:2]
	CD	Control/Data			0		
	WR0	$\overline{\text{WR}}$	$\overline{\text{R/W}}$	0			
	WR1	$\overline{\text{RD}}$	EN	0			
	D[6,2,1]	Data		--			
	D[5:3], D[0]	Data		D[5:3]=SDA, D[0]=SCK			

Connect unused control pins and data bus pins to V_{DD} for "H" or V_{SS} for "L".

	CS Disable Bus Interface	CS Init. Bus State	RESET Init. Bus State
8-bit	✓	–	✓
S8 or S9	✓	✓	✓
I ² C	–	–	✓

- CS disable bus interface – CS can be used to disable Bus Interface Write / Read Access.
- RESET can be pin reset / soft reset / power on reset.

Table 3: Host interfaces Summary

PARALLEL INTERFACE

The timing relationship between UC1604c internal control signal RD, WR and their associated bus actions are shown in the figure below.

The Display RAM read interface is implemented as a two-stage pipeline. This architecture requires that, every time memory address is modified, either in parallel mode or serial mode, by either Set CA or Set PA command, a dummy read

cycle need to be performed before the actual data can propagate through the pipeline and be read from data port D[7:0].

There is no pipeline in write interface of Display RAM. Data is transferred directly from bus buffer to internal RAM on the rising edges of write pulses.

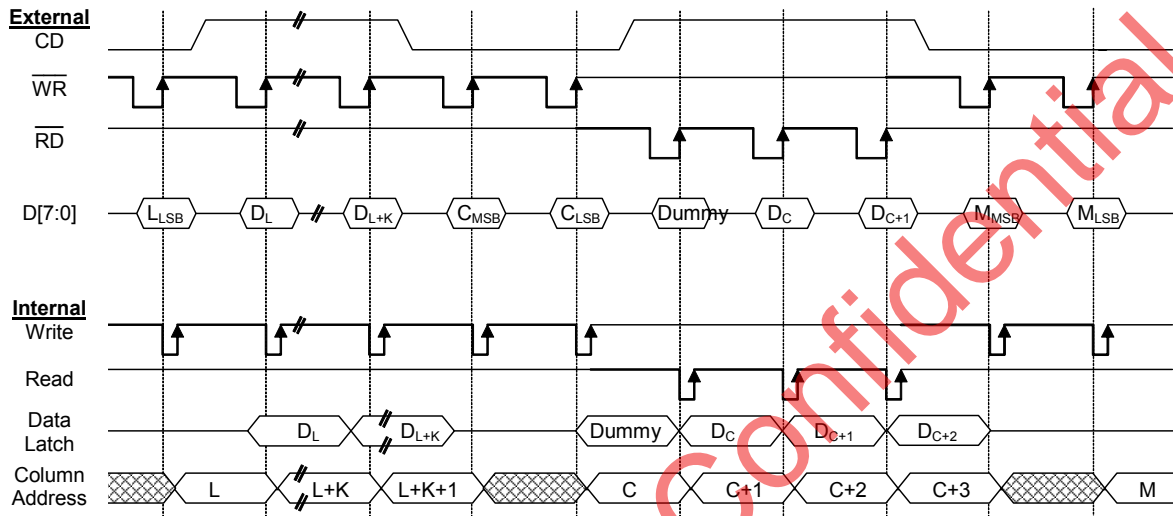

Figure 3: Parallel Interface & Related Internal Signals

SERIAL INTERFACE

UC1604c supports three serial modes, one 4-wire SPI mode (S8), one 3-wire SPI mode (S9) and one 2-wire SPI mode (I²C). Bus interface mode is determined by the wiring of the BM[1:0] and D[7]. See table in last page for more detail.

S8 (4-WIRE) INTERFACE

Pins CS[1:0] are used for chip select and bus cycle reset. Pin CD is used to determine the content of the data been transferred. During each write cycle, 8 bits of data, MSB first, are latched on eight rising SCK edges into an 8-bit data holder.

If CD=0, the data byte will be decoded as command. If CD=1, these 8 bits will be treated as data and transferred to proper address in the Display Data RAM on the rising edge of the last SCK pulse. Pin CD is examined when SCK is pulled low for the LSB (D0) of each token.

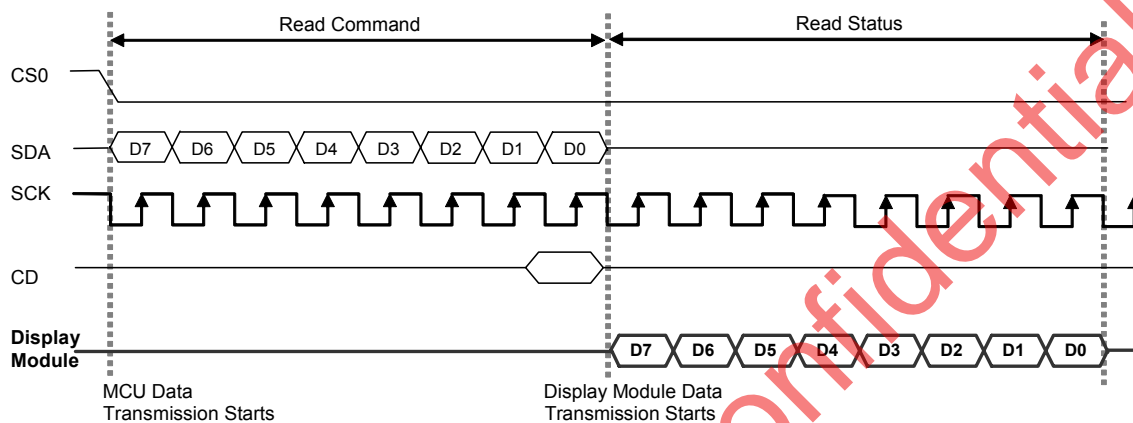

FIGURE 4.a: 4-wire Serial Interface (S8) – Read

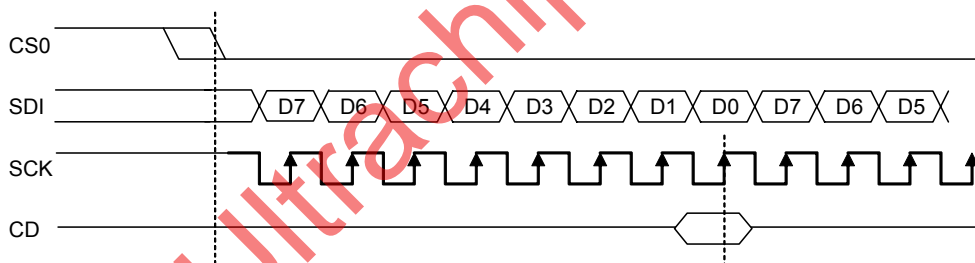

Figure 4.b: 4-wire Serial Interface (S8) – Write

S9 (3-WIRE) INTERFACE

Pins CS[1:0] are used for chip select and bus cycle reset. On each write cycle, the first bit is CD, which determines the content of the following 8 bits of data, MSB first. These 8 command or data bits are latched on rising SCK edges into an 8-bit data holder. If CD=0, the data byte will be decoded as command. If CD=1, this 8-bit will be treated as data and

transferred to proper address in the Display Data RAM at the rising edge of the last SCK pulse.

By sending CD information explicitly in the bit stream, control pin CD is not used, and should be connected to either V_{DD} or V_{SS} . The toggle of CS0 (or CS1) for each byte of data/command is recommended but optional.

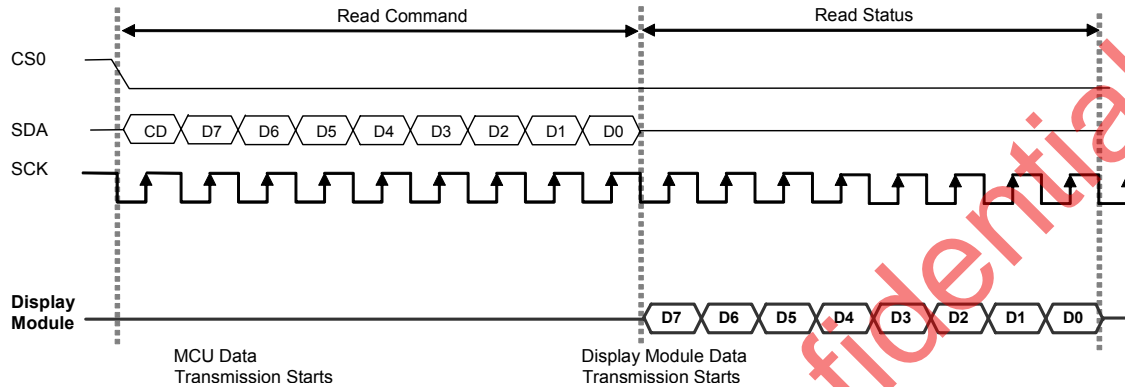

FIGURE 5.a: 3-wire Serial Interface (S9) – Read

Figure 5.b: 3-wire Serial Interface (S9) – Write

I²C (2-WIRE) INTERFACE

When BM[1:0] is set to "LH" and D[7] is set to "H", UC1604c is configured as an I²C bus signaling protocol compliant slave device. Please refer to I²C standard for details of the bus signaling protocol, and AC Characteristic section for timing parameters of UltraChip implementation.

In this mode, pins CS[1:0] become A[3:2] and is used to configure UC1604c' device address. Proper wiring to V_{DD} or V_{SS} is required for the IC to operate properly for I²C mode.

Each UC1604c I²C interface sequence starts with a "S" (Start) from the bus master, followed by a sequence header, containing a device address, the mode of transfer (CD, 0:Control, 1:Data), and the direction of the transfer (RW, 0:Write, 1:Read).

Since both WR and CD are expressed explicitly in the header byte, the control pins WR[1:0] and CD are not used in I²C mode and should be connected to V_{SS}.

Write Mode**Read Mode**

The direction (read or write) and content type (command or data) of the data bytes following each header byte are fixed for the sequence. To change the direction (R↔W) or the content type (C↔D), start a new sequence with a START (S) flag, followed by a new header.

After receiving the header, the UC1604c will send out a "A" (Acknowledge signal, pull to "L"). Then, depends on the setting of the header, the transmitting device (either the bus master or UC1604c) will start placing data bits on SDA, MSB to LSB, and the sequence will repeat until a STOP signal (P, in WRITE mode), or an N (Not Acknowledged, in READ mode) is sent by the bus master.

When using I²C serial mode, if command `System Reset` is to be written, the writing sequence must be finished (STOP) before succeeding data or commands start. The flow chart on the right shows a writing sequence with a "System Reset" command.

Note that, for data read (CD=1), the first byte of data transmitted will be dummy.

HOST INTERFACE REFERENCE CIRCUIT

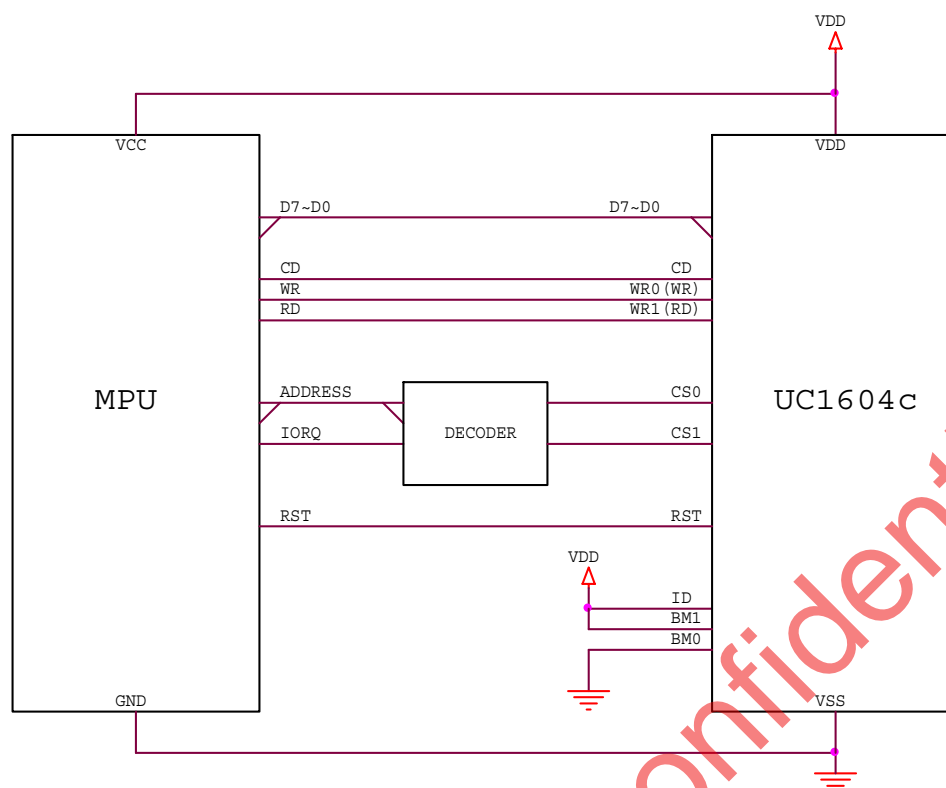

FIGURE 6: 8080/8bit parallel mode reference circuit

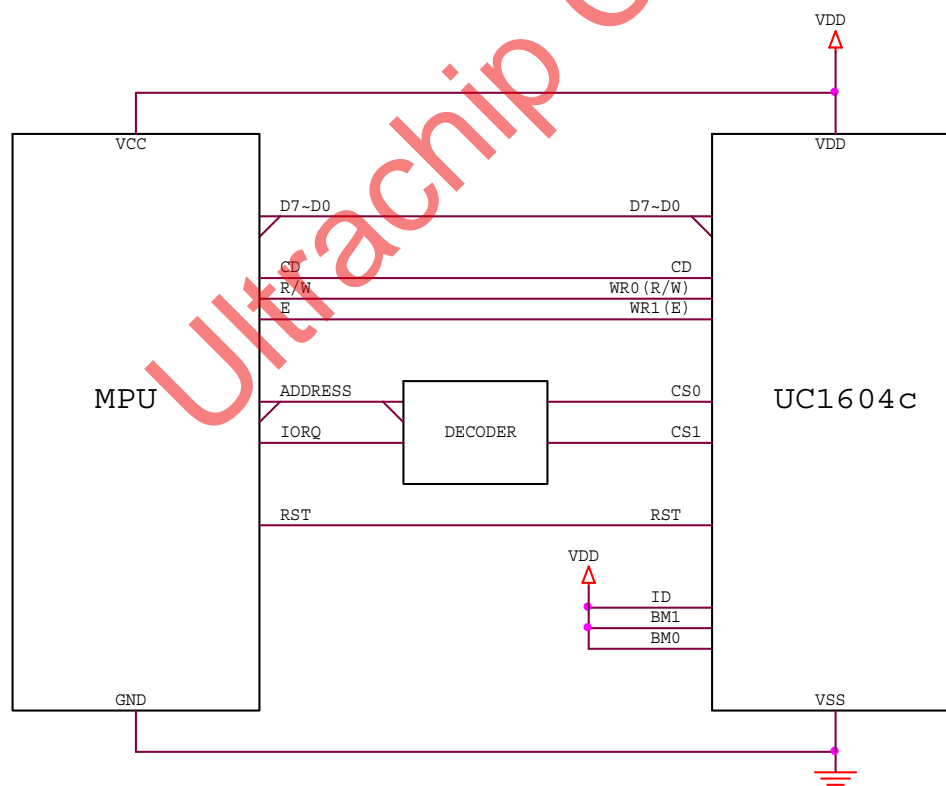

FIGURE 7: 6800/8bit parallel mode reference circuit

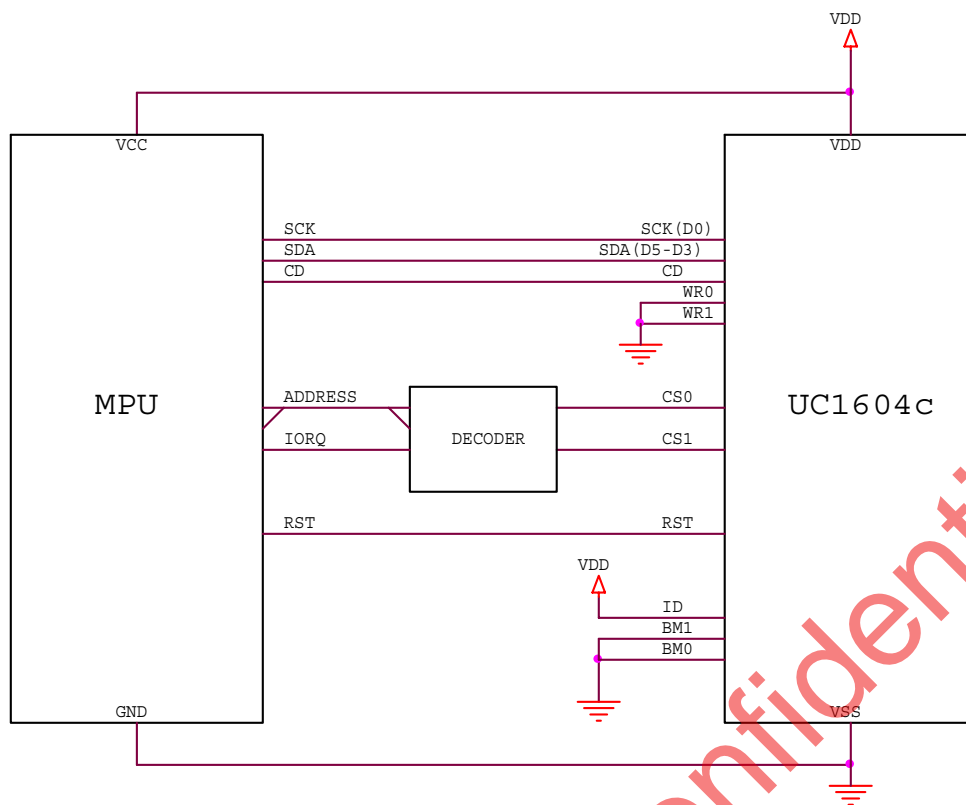

FIGURE 8: Serial-8 serial mode reference circuit

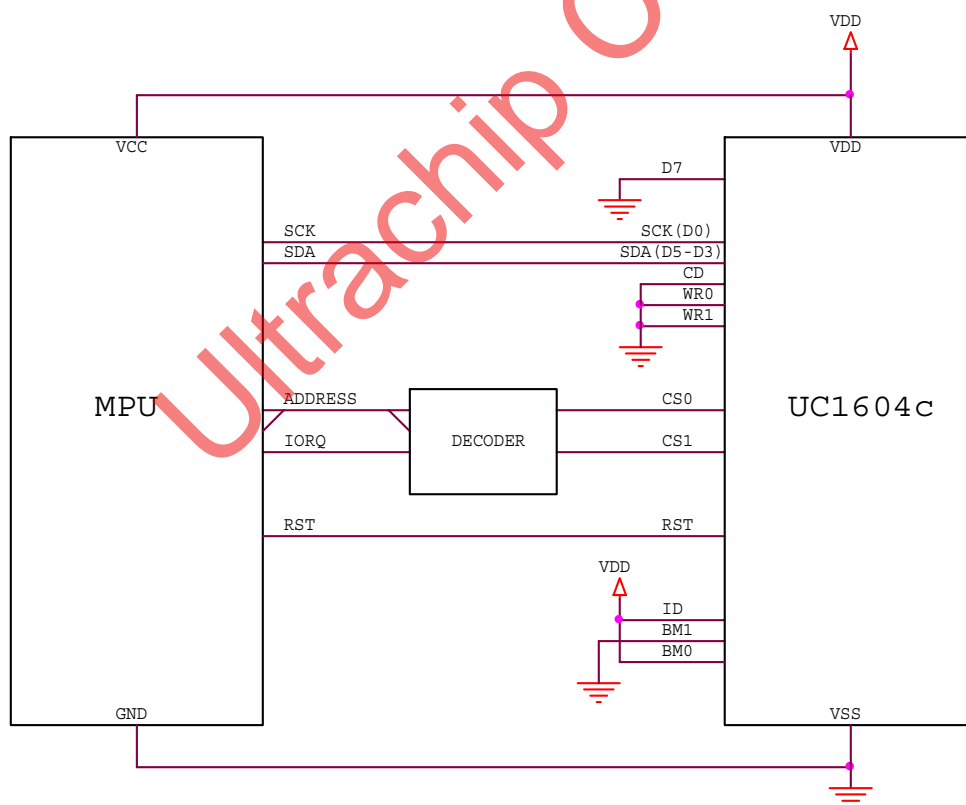

FIGURE 9: Serial-9 serial mode reference circuit

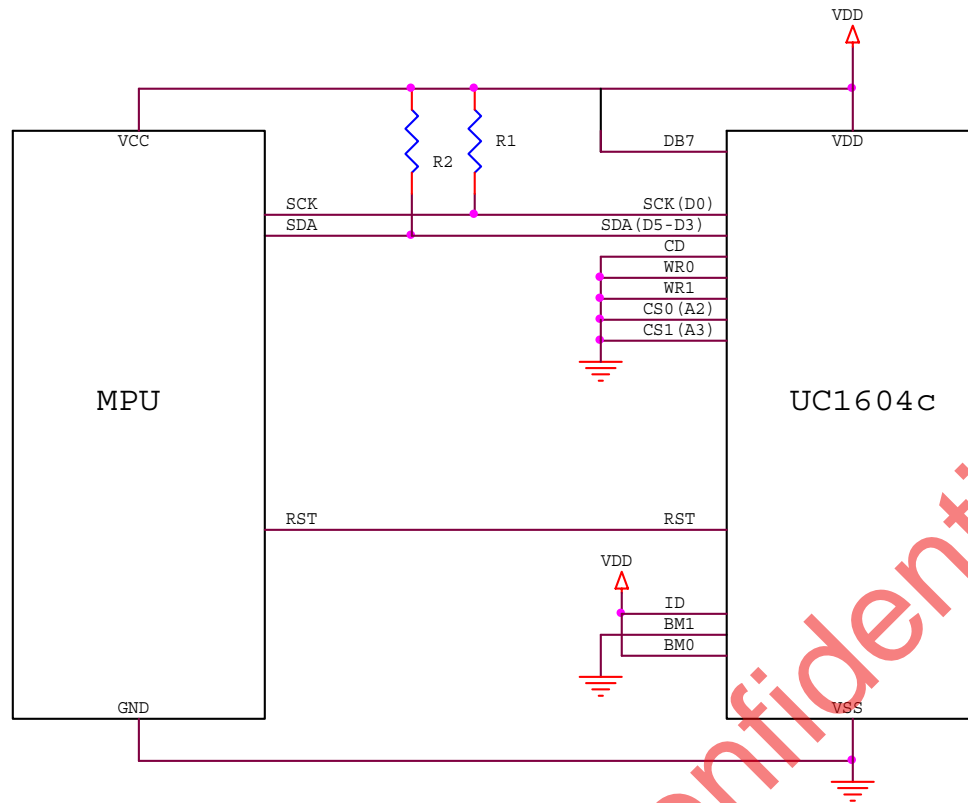

FIGURE 10: I²C serial mode reference circuit

Note

- The ID pins are for production control. The connection will affect the content of D[7] of the 1-st byte of the Get Status command. Connect to V_{DD} for "H" or V_{SS} for "L".
- RST pin is optional. When the RST pin is not used, connect it to V_{DD}.
- When using I²C serial mode, CS1/0 are user configurable and affect A[3:2] of device address.
- R1, R2: 2k ~ 10k Ω, use lower resistor for bus speed up to 3.6MHz, use higher resistor for lower power.

DISPLAY DATA RAM (DDRAM)

DATA ORGANIZATION

The input display data is stored to a dual port static DDRAM (DDRAM, for Display Data RAM) organized as 65x192.

After setting CA and RA, the subsequent data write cycle will store the data for the specified pixel to the proper memory location.

Please refer to the map in the following page between the relation of COM, SEG, SRAM, and various memory control registers.

DISPLAY DATA RAM ACCESS

The Display RAM is a special purpose dual port RAM which allows asynchronous access to both its column and row data. Thus, RAM can be independently accessed both for Host Interface and for display operations.

DISPLAY DATA RAM ADDRESSING

A Host Interface (HI) memory access operation starts with specifying Row Address (RA) and Column Address (CA) by issuing *Set Row Address* and *Set Column Address* commands.

If wrap-around (WA, AC[0]) is OFF (0), CA will stop increasing after reaching the end of row (191), and system programmers need to set the values of PA and CA explicitly.

If WA is ON (1), when CA reaches end of page, CA will be reset to 0 and PA will increase or decrease, depending on the setting of row Increment Direction (RID, AC[2]). When PA reaches the boundary of RAM (i.e. PA = 0 or 7), PA will be wrapped around to the other end of RAM and continue.

MX IMPLEMENTATION

Column Mirroring (MX) is implemented by selecting either (CA) or (191-CA) as the RAM column address. Changing MX affects the data written to the RAM.

Since MX has no effect of the data already stored in RAM, changing MX does not have immediate effect on the displayed pattern. To refresh the display, refresh the data stored in RAM after setting MX.

ROW MAPPING

COM electrode scanning orders are not affected by Start Line (SL), Fixed Line (FLT & FLB) or Mirror Y (MY, LC[2]). Visually, register SL having a non-zero value is equivalent to scrolling the LCD display up or down (depends on MY) by SL rows.

RAM ADDRESS GENERATION

The mapping of the data stored in the display SRAM and the scanning electrodes can be obtained by combining the fixed *Rm* scanning sequence and the following RAM address generation formula.

During the display operation, the RAM line address generation can be mathematically represented as following:

For the 1-st line period of each field

$$Line = SL$$

Otherwise

$$Line = \text{Mod}(Line+1, 64)$$

Where Mod is the modular operator, and *Line* is the bit slice line address of RAM to be outputted to column drivers. Line 0 corresponds to the first bit-slice of data in RAM.

The above *Line* generation formula produce the "loop around" effect as it effectively resets *Line* to 0 when *Line+1* reaches 64.

MY IMPLEMENTATION

Row Mirroring (MY) is implemented by reversing the mapping order between row electrodes and RAM, i.e. the mathematical address generation formula becomes:

For the 1st line period of each field

$$Line = \text{Mod}(SL + MR - 1, 64)$$

Otherwise

$$Line = \text{Mod}(Line-1, 64)$$

Visually, the effect of MY is equivalent to flipping the display upside down. The data stored in display RAM is not affected by MY.

Example for memory mapping: let $MX = 0$, $MY = 0$, $SL = 0$, according to the data shown in the above table:

⇒ Page 0 SEG 2 (D7-D0) : 1100 1100b

RESET & POWER MANAGEMENT

TYPES OF RESET

UC1604c has two different types of Reset:

Power-On-Reset and System-Reset.

Power-On-Reset is performed right after V_{DD} is connected to power. *Power-On-Reset* will first wait for about ~5mS,

depending on the time required for V_{DD} to stabilize, and then trigger the *System Reset*.

System Reset can also be activated by connecting the RST pin to ground.

In the following discussions, Reset means *System Reset*.

The differences between pin reset and software reset are

Procedure (Restoring to default value)	Pin Reset (Power On Reset)	Software Reset
Column Address : CA[7:0]=0	V	V
Page Address : PA[3:0]=0	V	V
RAM Address Control : AC[2:0]=001b	V	V
Temp. Compensation : TC[1:0]=00b	V	X
Power Control : PC[2:0]=110b	V	X
Scroll Line : SL[5:0]=0	V	X
Vbias Potentiometer : PM[7:0]=49h	V	X
Partial Display Control : LC[5]=0b	V	X
Frame Rate : LC[4:3]	V	X
All-Pixel-On : DC[1]=0b	V	X
Inverse Display : DC[0]=0b	V	X
Display Enable : DC[2]=0b	V	X
LCD Mapping Control : LC[2:1]=00b	V	X
Test Control	V	X
LCD Bias Ratio : BR[1:0]=11b	V	X
COM End : CEN[6:0]=63d	V	X
Partial Display Command	V	X
MTP Function Control	V	X

RESET STATUS

When UC1604c enters RESET sequence:

- Operation mode will be "Reset"
- All control registers are reset to default values. Refer to Control Registers for details of their default values.

OPERATION MODES

UC1604c has three operating modes (OM):
Reset, Sleep, Normal.

For each mode, the related statuses are as below:

Mode	Reset	Sleep	Normal
OM	00	10	11
Host Interface	Active	Active	Active
Clock	OFF	OFF	ON
LCD Drivers	OFF	OFF	ON
Charge Pump	OFF	OFF	ON
Draining Circuit	ON	ON	OFF

Table 4: Operating Modes

CHANGING OPERATION MODE

In addition to Power-ON-Reset, two commands will initiate OM transitions:

Set Display Enable, and *System Reset*.

When DC[2] is modified by *Set Display Enable*, OM will be updated automatically. There is no other action required to enter Sleep mode.

OM changes are synchronized with the edges of UC1604c' internal clock. To ensure consistent system states, wait at least 10 μ S after issuing the *Set Display Enable* command or triggering *System Reset*.

Action	Mode	OM
RST_ pin pulled "L" Power ON reset	Reset	00
Set Driver Enable to "0"	Sleep	10
Set Driver Enable to "1"	Normal	11

Table 5: OM changes

Both Reset mode and Sleep mode drain the charges stored in the external capacitors C_{B0} , C_{B1} , and C_L . When entering Reset mode or Sleep mode, the display drivers will be disabled.

The difference between Sleep mode and Reset mode is that Reset mode clears all control registers and restores them to default values, while Sleep mode retains all the control registers values set by the user.

It is recommended to use Sleep Mode for Display OFF operations as UC1604c consumes very little energy in Sleep mode (typically under 5 μ A).

EXITING SLEEP MODE

UC1604c contains internal logic to check whether V_{LCD} and V_D are ready before releasing COM and SEG drivers from their idle states. When exiting Sleep or Reset mode, COM and SEG drivers will not be activated until UC1604c internal voltage sources are restored to their proper values.

POWER-UP SEQUENCE

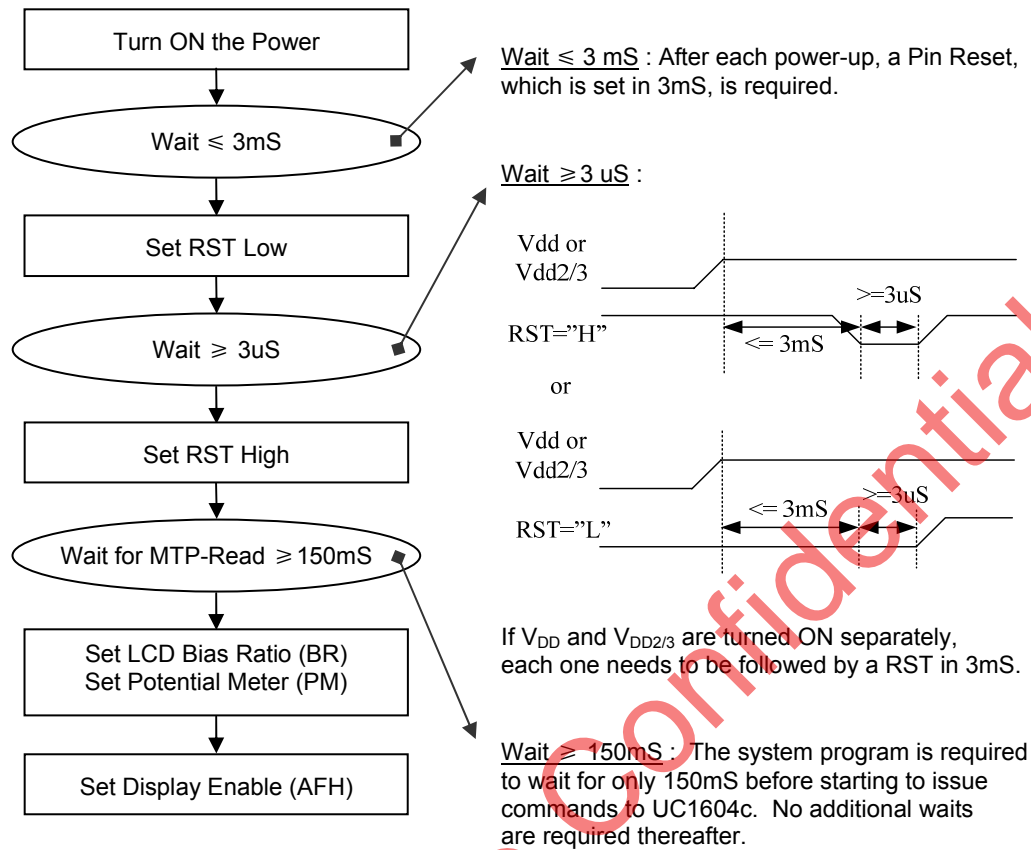

FIGURE 11: Reference Power-Up Sequence

There's no delay needed while turning ON V_{DD} and $V_{DD2/3}$, and either one can be turned ON first.

Figure 12: Power Off-On Sequence

ENTER/EXIT SLEEP MODE SEQUENCE

UC1604c enters Sleep mode from Display mode by issuing Set Display OFF command. To exit Sleep mode, Set Display ON.

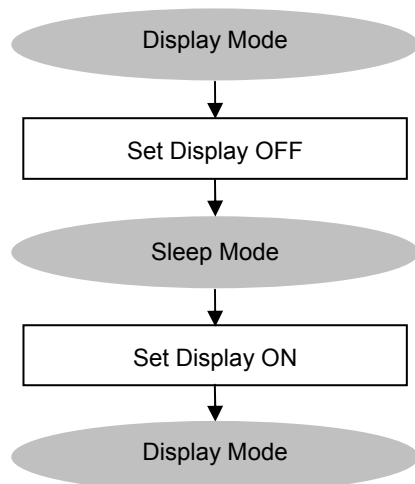

Figure 13 : Enter/Exit Sleep Mode Sequence

Power-Down Sequence

To prevent the charge stored in capacitor C_L causing abnormal residue horizontal line on display when V_{DD} is switched off, use Reset mode to enable the built-in charge draining circuit to discharge these external capacitors.

When internal V_{LCD} is not used, UC1604c will **NOT** drain V_{LCD} during RESET. System designers need to make sure external V_{LCD} source is properly drained off before turning off V_{DD} .

FIGURE 14: Reference Power-Down Sequence

MULTI-TIME PROGRAM NV MEMORY

OVERVIEW

MTP feature is available for UC1604c such that LCM makers can record an PM offset value in non-volatile memory cells, which can then be used to adjust the effective V_{LCD} value, in order to achieve high level of consistency for LCM contrast across all shipments.

To accomplish this purpose, three operations are supported by UC1604c:

MTP-Erase, MTP-Program, MTP-Read.

MTP-Program requires an external power source supplied to TST4 pin. MTP allows to program at least 10 times and should be performed only by the LCM makers.

MTP-Read is facilitated by the internal DC-DC converter built-in on UC1604c, no external power source is required, and it is performed automatically after hardware RESET (power-ON and pin RESET).

OPERATION FOR THE SYSTEM USERS

For the MTP version of UC1604c, the content of the NV memory will be read automatically after the power-on and hardware pin RESET. There is no user intervention or external power source required. When set up properly, the V_{LCD} will be fine tuned to achieve high level of consistency for the LCM contrast.

The MTP-READ is a relatively slow process and the time required can vary quite a bit. For a successful MTP-READ operation, the MS and WS bits in the *Read Status* commands will exhibit the following waveforms.

As illustrated above, the {MS, WS} will go through a {0,0}⇒{1,0}⇒{1,1}⇒{0,1} transition. When the {MS, WS}={0,1} state is reached, it means the LCM is ready to be turned on.

Although user can use *Read Status* command in a polling loop to make sure {MS, WS}={0, 1} before proceeding with the normal operations, however, it may be simpler to just issue *Set Display Enable* command every 0.5~2 second, repeatedly, together with other LCM optimization settings, such as BR, CEN, TC, etc.

The above “Periodical re-initializing” approach is also an effective safeguard against accidental display off events such as

- ESD strikes
- Mechanical shocks causing LCM connector to malfunction temporarily

HARDWARE VS. SOFTWARE RESET

The auto-MTP-READ is only performed for hardware RESET (power-ON and RST pin), but not for software *RESET* command. This enables the lcs to turn on display faster without the delay caused by MTP-READ.

It is recommended to use software *RESET* for normal operation control purpose and hardware RESET only during the event of power up and power down.

OPERATION FOR THE LCM MAKERS

Always ERASE the MTP NV memory cells, before starting the Write process.

MTP OPERATION FOR LCM MAKERS

1. High voltage supply and timer setting

In MTP Program operation, two different high voltages are needed. In chip design, one high voltage is generated by internal charge pump (V_{LCD}), the other high voltage must be input from TST4 by external voltage source.

V_{LCD} value is controlled by register MTP3 and MTP2. The default values of these two registers are appropriate for most applications.

External TST4 power source is required for MTP Program operation. MTP Programming speed depends on the TST4 voltage. Considering the ITO trace resistance in COG modules, it is recommended to program the MTP cells one at a time, so that the required 10V at TST4 can be maintained with proper consistency.

No external power source is required for MTP Erase and Read operation. For these MTP operations, TST4 should be open, or connected to V_{DD3} .

	V_{LCD}	TST4 (external input)
Program	MTP3 : FFh (12V)	10V (1mA per bit)
Erase	MTP3 : FFh (12V)	Floating or V_{DD3}
Read	MTP2 : 64h (6.4V)	Floating or V_{DD3}

Note: Do Erase before Program and program one bit at a time.

2. Read MTP status bits

With normal Get Status method (CD=0, W/R=1), MTP operation status can be monitored in the real time. There are 3 status bits (WS, MD, MS) in status register. MTP control circuit will read to verify if the operation (program, erase) success or not. If the operation succeeded, and current

operation will be ended with WS=1. If it failed, last operation will be automatically retried two more times. If it fails 3 times, WS will be set to 0 and the operation is aborted. MD is MTP ID, which is either 1 for MTP IC. No transition.

MTP status bits, TST4 & V_{LCD} Waveform

3. MTP Cell Value Usage

There are 6 MTP cell bits. They are divided into two groups for different purpose.

MTP[5:0] : V_{LCD} Trim

When PMO[5]=1: PM with trim = PM - PMO[4:0]

When PMO[5]=0: PM with trim = PM + PMO[4:0]

MTP COMMAND SEQUENCE SAMPLE CODES

The following tables are examples of command sequence for MTP Program and Erase operations. These are only to demonstrate some “*typical, generic*” scenarios. Designers are encouraged to study related sections of the datasheet and find out what the best parameters and control sequences are for their specific design needs.

MTP operations (Erase, Program, Read) and Set Display ON is mutual exclusive. There is no harm done to the IC or the LCM if this is violated. However, the violating commands will be ignored.

Type Required: These items are required
 Customized: These items are not necessary if customer parameters are the same as default
 Advanced: We recommend new users to skip these commands and use default values.
 Optional: These commands depend on what users want to do.

C/D The type of the interface cycle. It can be either Command (0) or Data (1)

W/R The direction of dataflow of the cycle. It can be either Write (0) or Read (1).

MTP Program Sample Code

Type	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Chip Action	Comments
R											Set RST pin Low	Wait 3uS after RST is Low
R											Set RST pin High	Wait 150mS
R	0	0	1	0	1	0	0	0	1	1	Set Line Rate	Set LC[4:3]=11b
R	0	0	1	1	1	1	0	1	0	0	Set V _{MTP1} Potentiometer	Set MTP V _{LCD}
R	0	0	0	1	1	0	0	1	0	0		MTP2: 64h (6.4V)
R	0	0	1	1	1	1	0	1	0	1	Set V _{MTP2} Potentiometer	Set MTP V _{LCD}
R	0	0	1	1	1	1	1	1	1	1		MTP3: FFh (12V)
R	0	0	1	1	1	1	0	1	1	0	Set MTP Write Timer	Set MTP Timer
R	0	0	0	0	0	0	0	0	1	0		MTP4: 02h (100mS)
R	0	0	1	1	1	1	0	1	1	1	Set MTP Read Timer	Set MTP Timer
R	0	0	0	0	0	0	0	0	1	0		MTP5: 02h (10mS)
R	0	0	1	1	1	1	1	0	0	1	Set MTP Write Mask	Set MTP Bit Mask
C	0	0	0	0	0	0	0	0	0	1	MTPM	Ex: To program MTPM[0] to be 1, set the value to 00000001b *
R												Apply TST4 voltage Program: 10V
R	0	0	1	0	1	1	1	0	0	0	Set MTP Control	Set MTPC[3]=1
R	0	0	-	-	0	0	1	0	1	1		Set MTPC[2:0]=011
R	0	1	-	-	-	-	-	WS	-	MS	Get Status & PM	Check MTP Status until MS=0, WS=1
R												Remove TST4 voltage
R											V _{DD} =0V	Power OFF

* It is recommended that users program one bit at a time.

MTP Erase Sample Code

Type	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Chip action	Comments
R											Set RST pin Low	Wait 3uS after RST is Low
R											Set RST pin High	Wait 150mS

R	0	0	1	0	1	0	1	1	1	1	Set Display Enable	

ESD CONSIDERATION

UC1600 series products usually are provided in bare die format to customers. This makes the product particularly sensitive to ESD damage during handling and manufacturing process. It is, therefore, highly recommended that LCM makers strictly follow the “JESD 625-A Requirements for Handling Electrostatic-Discharge-Sensitive (ESDS) Devices” when manufacturing LCM.

The following pins in UC1604c require special “ESD Sensitivity” consideration in particular:

Test Mode Pins		Machine Mode		Human Body Mode	
		V _{DD}	V _{SS}	V _{DD}	V _{SS}
LCD Driver		150V	150V	1.5KV	1.5KV
LCM Digital Interface		300V	300V	3.0KV	3.0KV
LCM HV Interface	TST1/2/4	300V	250V	3.0KV	3.0KV
	C _B pins	300V	300V	3.0KV	3.0KV
	V _{LCDIN}	200V	200V	3.0KV	3.0KV
	V _{LCDOUT}	300V	300V	3.0KV	3.0KV
PWR/GND		-	300V	-	3.0KV

According to UltraChip's Mass Production experiences, the ESD tolerance conditions are believed to be very stable and can produce high yield in multiple customer sites. However, special care is still required during handling and manufacturing process to avoid unnecessary yield loss due to ESD damages.

ABSOLUTE MAXIMUM RATINGS

In accordance with IEC134 – notes 1, 2 and 3.

Symbol	Parameter	Min.	Max.	Unit
V_{DD}	Logic Supply voltage	-0.3	+4.0	V
V_{DD2}	LCD Generator Supply voltage	-0.3	+4.0	V
V_{DD3}	Analog Circuit Supply voltage	-0.3	+4.0	V
$V_{DD2/3}-V_{DD}$	Voltage difference between V_{DD} and $V_{DD2/3}$	--	1.2	V
V_{LCD}	LCD Generated voltage	-0.3	+13.2	V
V_{IN} / V_{OUT}	Any input/output	-0.4	$V_{DD} + 0.3$	V
T_{OPR}	Operating temperature range	-30	+85	°C
T_{STR}	Storage temperature	-55	+125	°C

Notes

1. V_{DD} is based on $V_{SS} = 0V$
2. Stress values listed above may cause permanent damages to the device.

TRAY INFORMATION

REVISION HISTORY

Revision	Contents	Date
0.6	(First Release)	Jul. 22, 2010
0.8	(1) The connections for the D[5:3] pins, related to SDA-read and SDA-write, are modified.	Jan. 11, 2011
	(2) The data for section "VLCD Quick Reference" is updated.	
	(3) For DC characteristics, VDD (Min.) is adjusted: 1.65V --> 1.7V	
	(4) The typical value and the maximum value for R0(SEG) and R0(COM) are adjusted.	
	(5) The maximum power consumption presents.	
	(6) The AC timings present.	
1.0	(Same as revision 0.8)	Feb. 8, 2011
1.01	A Read command for S8 and S9 mode is added.	Jun. 27, 2011
1.1	Another set of pad information is provided.	Mar. 23, 2012
